RANK of a Matrix

Rank:

The number of non-zero rows in REF is called rank of the matrix.

Or

The number of pivots in REF is called rank of the matrix.

Example:

$$\begin{pmatrix} 1 & 2 & -1 & 0 \\ 0 & 3 & 4 & 1/2 \\ 0 & 0 & -44 & -4 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad \text{REF} \quad \text{Rank} = 3$$

$$\begin{pmatrix} 1 & 2 & -1 & 0 \\ 0 & 3 & 4 & 1/2 \\ 0 & 0 & -44 & -4 \\ 0 & 0 & 0 & 0 \end{pmatrix} \quad \text{REF} \quad \text{Rank} = 3$$

PROPERTIES OF RANK OF A MATRIX

- Rank of a null matrix/zero matrix is always zero.
- Rank of any non-zero matrix is always greater than or equal to 1.
- $\text{rank}(A_{m \times n}) \leq \min(m, n)$

Example: $\text{rank}(A_{5 \times 3}) \leq \min(5, 3)$

- Let $A = (a_{i,j})_{n \times n}$ be any non-singular matrix then $\text{rank}(A) = n$.
- $\text{rank}(A) = \text{rank}(A^T)$. i.e., Rank of transpose of matrix A is always equal to rank of A.
- The column rank of a matrix is always equal to its row rank
- Rank of product of two matrices cannot exceed the rank of both of the matrices.
